

Understanding Static Website
Hosting on Amazon S3

Through a House Metaphor

The Land & Building

Understanding foundational website components

The Land

The **Land (S3 Bucket)** serves as the foundation where the house, or website files, is established, storing all essential static assets like HTML and CSS.

The Building

The **Building (HTML/CSS)** represents the visible structure of the house, where HTML creates rooms and walls, while CSS adds style, decoration, and overall layout to the site.

The Street Address

Understanding how visitors find your site

The Street Address

The official address that visitors use to find the house, converting names like `www.myresume.com` into an actual location (IP address) of the land (S3 bucket).

The Roads

HTTP is an open dirt road, while HTTPS is a paved, tree-lined road that provides a secure and trusted connection for visitors entering the house.

The Highway

Connecting Visitors to Your Website

The Highway

The Highway (CloudFront) serves as a **high-speed route** that connects visitors globally to your website, ensuring quick access and a seamless experience.

The Visitor Log

The Visitor Log (Lambda + DynamoDB) acts as an automated record keeper, logging every visitor's arrival at your site, much like a guestbook documenting each guest.

Recap

Understanding website hosting with a metaphor

In summary, **using the house metaphor** helps visualize how website hosting components connect, making the concepts easier to grasp and remember for better learning.

Thank You!
